

PCoA1 (22.2%)

PCoA2 (19.3%)

Filled circle = honey | Open/white = pollen

The plot shows a clear separation between the two groups. The 'honey' group (filled circles) is clustered on the right side of the plot (positive PCoA1 values), while the 'pollen' group (open/white shapes) is clustered on the left side (negative PCoA1 values). A dashed ellipse encloses the majority of the data points, which are primarily from the pollen group. A legend at the bottom right indicates that filled circles represent honey and open/white shapes represent pollen.
